Description. The genetic, molecular, and cellular mechanisms of neural development are essential for understanding evolution and disorders of neural systems. Recent advances in genetic, molecular, and cell biological methods have generated a massive increase in new information, but there is a paucity of comprehensive and up-to-date syntheses, references, and historical perspectives on this important subject.

A neural circuit consists of neurons that are interconnected by synapse. Once activated, they carry a specific function. They connect forming a large scale brain network. Neural circuits are both functional and anatomical entities.

signal timing and metabolic support for axons. Myelination can robustly influence neural circuit dynamics (for review, see Mount and Monje, 2017). The geometric properties of myelinated internodes, including sheath thickness and internode length, contribute to conduction velocity, together with the diameter of the axon itself.

The expression, secretion and actions of BDNF are directly controlled by neural activity, and secreted BDNF is capable of mediating many activity-dependent processes in the mammalian brain, including neuronal differentiation and growth, synapse ...

Emerging roles of astrocytes in neural circuit development. Astrocytes are now emerging as key participants in many aspects of brain development, function and disease. In particular, new evidence shows that astrocytes powerfully control the formation, maturation, function and elimination of synapses through various secreted and contact-mediated signals.

Here, by cell type-specific dissection of Arid1a function, we uncover an unexpectedly selective role for this ubiquitous chromatin remodeler in subplate neuron molecular identity and circuit wiring function. We find that pan-cortical deletion of Arid1a, but not sparse deletion, leads to ...
