## **Statistical Inference Course Notes - GitHub Pages**

In statistical inference, we care about using sample data to make statements about “truths” in the larger population. To make causal inferences in the sample, we need to account for all possible confounding

# Get Free Statistical

variables, or we need to randomize the “treatment” and assure there are no other possible reasons for an observed effect.

## **Inference Theory 1, Fall 2018, Uppsala - SDS**

168,189 recent views.  
Statistical inference is

# Get Free Statistical

the process of drawing conclusions about populations or scientific truths from data. There are many modes of performing inference including statistical modeling, data oriented strategies and explicit use of designs and randomization in analyses.

Furthermore, there

# Get Free Statistical

Inference theories (frequentists, Bayesian, likelihood, design based, ...) and numerous complexities (missing data, observed and unobserved confounding, biases) for performing inference.

**Statistical Inference**  
**| Coursera**

*Page 35/37*

# Get Free Statistical

In this course we limit ourselves to the parametric inference. Parametric inference is a special case of the statistical inference where it is assumed that the functional form of the joint distribution of the random vector  $Y$  is fixed up to the value of the parameter vector  $\theta = (\theta_1, \dots, \theta_d)$  ?
